Frequency matrix of names and parallels in the Bible

By *V. P. Fomenko* and *T. G. Fomenko*

Frequency square matrix of *names in the Bible*. The Bible is broken up into 218 'generation chapters'; therefore the size of the matrix should be 218 × 218. These 'generation chapters' are different from the regular chapters in the Bible. For more detail, see Chron1, Ch. 5:9.

The leftmost column of numbers contains the numbers of *lines* in the matrix. After that, the frequencies of this line are listed. We do not enter zeros. Moreover, within every conglomeration like that, the column numbers are given *in succession – without gaps*, that is.

The number in parentheses denotes the value of the initial column of this conglomeration of non-void frequencies. One can see the list of frequencies for every such frequency conglomeration (the ones that do not equal zero).

Here we have a square frequency matrix of *parallel places (repetitions, anagoges and the like) in the Bible*. The Bible is broken up into 218 'generation chapters'.

The size of the matrix is 218×218. The numbers in the leftmost column indicate the amount of lines in the matrix. After that, we give a listing of non-zero frequencies for every line. Moving along the line from the left to the right, we omit the zeroes. As soon as we come across a conglomeration of frequencies other than zero arranged in succession, that is, without gaps, we indicate the number of a column that which this group of frequencies *begins with*. We no longer give the numbers of the following columns (within this group of frequencies). For instance, in line 2 you will see (among other things) the following group of numbers: (170) = 2, 24. This means that in line 2, column 170, one can observe the frequency of 2, following it in column 171 – frequency 24, etc. Within

every conglomeration of frequencies of this variety, their column numbers follow *sequentially* – that is, *without gaps.*

The square frequency matrix of *parallel places (repetitions, or anagoges) in the Bible after the identification* of the duplicates in the *T* series. This 'summary chapter *T*' is placed in the 15th position. The matrix obtained as a result satisfies the frequency damping principle a great deal better. However, since we have not yet identified all the duplicates, the matrix is not completely 'evenly damped' yet.

During this operation, the size of the matrix decreases somewhat. Having changed the order of 'generation chapters', we did not calculate the frequencies from scratch, but restricted ourselves to describing the relocation of part of its frequencies. The remaining columns and lines retained their previous numbers. It is obvious that certain numbers of lines and columns have now disappeared.
